Subject:	silo library cores writing multivar with block-only namespace		
Description:	<p>Brian Ryujin reported this.</p> <p>The test example, multi_file.c does namespaces for the _file_ part and the _block_ part of multi-block objects separately. That test works. But, if its possible to map the whole thing into a single namespace string, then just the block part is necessary and that is resulting in a core dump.</p>
